

AI Usage DISCLOSURE FORM

1. Team Details

Team Name: EthosAI

Project / Product Name: EthosAI

Organization / Institution (if any): M S Ramaiah Institute of Technology

Submission Date: 08-05-2026

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? Yes / No

Yes

3. Purpose of AI Usage (Brief Details)

Idea generation / brainstorming:

We used AI tool Claude primarily for research and ideation purposes during the initial phase of the project. AI was used to study existing challenges and gaps in current Generative AI ecosystems, including policy compliance, website access permissions, licensing awareness, and AI governance practices. The outputs helped us refine the problem statement, understand existing limitations in AI compliance systems, and structure the overall direction and workflow of the EthosAI solution.

Code generation or assistance:

AI assistance was partially used during backend development to accelerate implementation and improve development efficiency. Core logic, architecture decisions, compliance workflows, and system integration were designed and implemented by the team, while AI tools were used for code suggestions, boilerplate generation, debugging assistance, and improving development speed. Additionally, Antigravity was used to support frontend implementation and UI component generation.

UI / UX design:

We used Antigravity to assist in frontend UI generation and interface design. AI helped in creating responsive layouts, improving visual consistency, and speeding up the development of user interface components. Final UI structure, workflow decisions, and feature placement were reviewed and customized manually by the team according to project requirements.

Content creation:

AI tools such as Claude and ChatGPT were used to assist in generating and organizing structured datasets required for model training. This included collecting and formatting information related to robots.txt accessibility, Terms of Service availability, paywall presence, licensing indicators, and website metadata. AI was used to streamline research and CSV dataset preparation, while verification and final dataset structuring were handled manually. Image for User Interaction flow was generated using ChatGPT.

Data analysis:

No AI tools were used for data analysis. All analysis, interpretation, validation, and decision-making related to the dataset and model behavior were performed manually by the team.

Testing / debugging:

No AI tools were used for testing or debugging purposes. Testing, validation, and issue resolution were conducted manually by the development team.

Other:

No AI tools were used for any additional purposes outside the categories mentioned above.

4. Feature Origin Classification (Please add/delete based on the number of the feature)

1] Multi-Stage Compliance Engine

Self-Generated/AI-Generated/Both: **Both**

Description

AI tools/platforms used:

We used ChatGPT and Claude to assist in dataset generation and structuring for training the compliance engine models. The actual machine learning models and overall pipeline architecture were designed and implemented by the team.

Prompt used:

“For the list of companies given in csv file, make 3 csv files called - similarity_test, priceclassifier, permission classifier.” (format for each csv file and list of companies was attached in the prompt)

Output summary:

The AI tools generated three structured CSV datasets in the requested format:

- **similarity_test** → dataset for similarity and content relationship analysis
- **priceclassifier** → dataset for pricing and licensing category classification
- **permission classifier** → dataset for determining whether website access policies are Allowed, Conditional, or Restricted

These datasets were used as the foundation for training three independent models running in parallel within the Multi-Stage Compliance Engine. The engine performs:

- Robots.txt analysis
- Terms of Service extraction
- Permission classification using a dedicated PyTorch-based ML model

Modification:

After generation, the datasets were manually reviewed and balanced by the team. In cases where certain classification categories had significantly fewer samples compared to others, additional rows and examples were manually added to improve class balance and ensure better model training performance and prediction reliability.

2] OpenCLAW Semantic Reasoning

Self-Generated/AI-Generated/Both: **Both**

Description

AI tools/platforms used:

We used Claude to refine and improve the semantic analysis prompt used within the OpenCLAW module. The backend logic, API integration, workflow handling, and semantic reasoning pipeline were designed and implemented by the team. The system uses a locally hosted Ollama instance running the Llama 3 model for policy analysis.

Prompt used:

“Modify the given prompt to get the desired output.”

The desired output requirements were explained in multiple steps, including:

- Detecting whether AI training or scraping is permitted
- Identifying licensing restrictions
- Extracting important legal and compliance-related signals
- Determining an overall compliance risk level

Output summary:

The OpenCLAW semantic reasoning module processes website policy text and performs semantic legal analysis beyond basic keyword matching. The system sends extracted policy content to the locally hosted Llama 3 model through the Ollama API and generates a structured compliance-oriented response.

The output includes:

- Whether AI training or scraping is allowed
- Presence of licensing or usage restrictions
- Important legal signals identified from the policy text
- A categorized overall risk level (Low / Medium / High)

This enables EthosAI to understand contextual legal intent and detect nuanced restrictions such as paywalls, non-commercial clauses, and licensing conditions that traditional rule-based scrapers may miss.

Modification:

The semantic analysis prompt was iteratively refined and improved using Claude to generate more structured, accurate, and compliance-focused outputs. Multiple prompt adjustments were made to improve clarity, response consistency, and legal signal extraction quality.

3] Explainable AI (XAI)

Self-Generated/AI-Generated/Both: **Both**

AI tools/platforms used:

The Explainable AI module uses Ollama integrated with the Llama 3 model to generate human-readable reasoning reports. The integration pipeline, backend workflow, and explainability framework were designed and implemented by the team.

Prompt used:

The module uses the semantic analysis prompt generated within the OpenCLAW workflow to process extracted policy and compliance data.

Output summary:

After the compliance and semantic analysis stages are completed, the integrated Llama 3 model generates a natural language reasoning report explaining why a particular compliance decision was made. Instead of returning a simple “allowed” or “restricted” output, the system provides developers and AI agents with a justified explanation for each decision.

Examples of generated reasoning include:

- Identification of restrictive Terms of Service clauses
- Detection of automated scraping limitations
- Explanation of licensing or paywall restrictions
- References to specific sections or legal conditions influencing the decision

This Explainable AI layer improves transparency, auditability, and trust in the compliance decision-making process.

Modification:

No additional AI-based modifications or refinements were performed for this module.

4] AI-First Middleware Architecture

Self-Generated/AI-Generated/Both: **AI-generated**

AI tools/platforms used:

We used Antigravity to assist in developing the AI-first middleware integration layer and frontend interaction flow for API connectivity.

Prompt used:

“The LLM should use our API key and it should properly give the output to the LLM after it pastes the one-line code given by us in the frontend.”

Output summary:

The generated implementation enabled seamless middleware integration between EthosAI and external AI systems. The output included a one-line integration code containing the API key, allowing developers and AI agents to quickly connect with the EthosAI API infrastructure.

The architecture supports:

- RESTful API-based integration
- Machine-readable structured JSON responses
- AI agent compatibility for tools such as ChatGPT Actions, Claude, and LangChain-based workflows
- AI manifest support through /.well-known/ai-plugin.json for automated tool discovery by AI agents

This allows external AI systems to interact with EthosAI and receive structured compliance analysis results in an automated manner.

Modification:

The generated integration flow was refined to ensure the one-line code was directly copy-pastable from the frontend, simplifying developer onboarding and reducing integration complexity.

5] Premium Command Center (Dashboard)

Self-Generated/AI-Generated/Both: **AI-generated**

AI tools/platforms used:

We used Antigravity to assist in developing the frontend dashboard and user interface for the EthosAI platform.

Prompt used:

“Read into the existing backend and ML model and make frontend for users such that they can give website URL, and the backend output is displayed properly after processing. No hardcoded stuff should be there.”

Output summary:

The generated frontend provided a fully interactive dashboard interface for users to interact with the EthosAI system. The interface allows users to submit website URLs and view processed compliance analysis results returned dynamically from the backend and ML models.

The dashboard includes:

- A modern glassmorphism-based UI design
- Responsive Light and Dark theme modes
- Dynamic backend integration without hardcoded outputs
- Structured display of compliance analysis results
- Real-time analytics visualization using Chart.js graphs for monitoring compliance-related trends and usage patterns

This created a centralized command center for monitoring and interacting with the EthosAI compliance engine.

Modification:

The generated frontend was refined to ensure proper backend connectivity, dynamic rendering of model outputs, responsive behavior across devices, and seamless user interaction without relying on static or hardcoded data.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. **Yes**

No proprietary or copyrighted data misused. **I Agree**

6. Declaration & Sign-Off

Name of Team Representative: Ankitha D

Role: Machine Learning Architect

Signature:

A handwritten signature in blue ink, appearing to read 'Ankitha D.', is shown within a rectangular frame.

Date:07-05-2026
